

Long delays. Stripped of the bells and whistles. Real analog tape delay. Works with any VST-compatible sound library or music software. Nihon 8 is a collection of the best sounding FX plug-ins that are designed for use with non-English speaking musicians. This package is designed to meet the needs of musicians using Japanese, Chinese, Korean or other non-English-based dialects. The tools contained in this collection are designed to complement an IEM device or other type of microphone. For example, the Pitch Shift section of the box allows you to shift the pitch of any sound in your session. This can be useful when performing in a non-native language where the pitch of some of the sounds used is not what is expected by the client or fellow musicians. For example, a Japanese band often sings or plays in Japanese, while a musician from another region is singing or playing in a language like English. If the musician is speaking Japanese or English but a chord is played in a different key, it could be advantageous to shift the pitch of the sound being sung or played. The Fader can be used to mute or lower the volume of an audio file. It is primarily used to set the music levels, but can also be used to mute a track in the middle of a mix. The Noise Gate and the Stereo Separate EQ can be used to clean up noisy tracks and help separate elements within the track. All of the other tools contained in this box can be used in a non-English-speaking market or scenario. For example, the Delay, the Reverb, the Compressor, the Chorus, the Equalizer, the Envelope Filter, the Flanger, the Phaser, the Pitch Shift and the Stereo Separate EQ can be used to enhance and compliment the sounds of a non-English-speaking band. In other words, this box contains the very best plug-ins that are optimized for non-English-speaking users. Many of the plug-ins in the box are commonly used by musicians of non-English-speaking countries. These plug-ins were not designed for English-speaking musicians, so they are particularly suited to non-English users. They are not designed to give English speakers a competitive edge over other musicians. The effect can be used to add a sense of depth, motion, decay, phasing and delay to the sound. In addition to the delay section, the plugin offers four additional channels that can be set to chorus, delay, tremolo, and a tape simulator. The Tremolo channel simulates the tremolo effect produced by vintage tape echo machines. The plugin can simulate the shape of the tape (that is, a varying pitch and decay), the tempo and the tape speed. If you want the plugin to behave as a tape echo, then you should set the algorithm to 'vintage'. There are five main parameters that you can configure to control the delay time, pitch, decay, speed and instant loop length. Each of these parameters can be adjusted in a real time with the dedicated controls. Features: ◆ Unique Tape delay, Phasing and Fuzz effect. ◆ Delay time can reach up to 3600 seconds (an hour). ◆ Loop length can be set while recording. ◆ Pitch and decay control. ◆ Adjustable line length. ◆ Real time controls. ◆ Open loop mode. ◆ Can be reversed in real time. ◆ Can be set to fade up and down. ◆ Can be set to dissolve seamlessly. ◆ Can be set to support inertia free mode. ◆ Can be set to emulate a classic tape echo. ◆ Integrated tremolo, chorus and delay effects. ◆ Can be set to switch smoothly between delay and tremolo, delay and chorus or tremolo and chorus. ◆ Can be set to fade from delay to chorus or tremolo, delay to chorus or tremolo. ◆ Can be set to fade between the fade up and down. ◆ Can be set to fade up to maximum pitch. ◆ Can be set to fade down to zero. ◆ Can be set to change smoothly (it will fade in and out). ◆ Can be set to fade up to maximum pitch and down to zero. ◆ Can be set to gradually fade to fade out. ◆ Can be set to clear automatically after one time. ◆ Can be set to support either MIDI or Audio I/O. ◆ Can be set to support Real Time MIDI. ◆ Can be set to support MIDI sync. ◆ Can be set to support OSC (MIDI). ◆

Augustus Loop is a VST plugin that features a unique tape-based delay effect that you could use to enhance your mixes. According to the developer, the plugin comes with several additional features that makes it easy to integrate with the looping device of your choice. The delay is quite long and can reach a maximum of 3600 seconds or one hour. In addition, you can to record and set the loop delay time while recording your first phrase. If you want to add a little extra touch to the effect, then you can consider employing the tape sim section and thus, emulate the signal degradation specific to vintage tape echo machines. Since the idea is to enable you to simulate an old-school tape delay, it means you can reverse the direction, stop it any time, change the time smoothly or adjust the speed by increasing or decreasing the pitch. To achieve smooth transitions, the plugin can be set to fade up and down automatically in your playing and it can even clear the loop one time after the fade out. The seamless transitions can also be obtained via the inertia free mode that has the role of suppressing the tape-like behavior when you are changing the delay times between the loop lengths. Features: Tape-based delay that can be configured to provide an initial delay or to simulate the delay time as the loop is played back Positive and negative loop sections that you can reverse or change the length of while recording The tape sim section enables you to simulate the inherent degradation that tape used to have while running The modulation controls can be used to adjust the length and speed of the delay Automatic fade up and down for the loop Loop one time clear on loop end to avoid accidental looping Inertia free mode that suppresses the tape-like behavior when changing the delay times Since the idea is to enable you to simulate an old-school tape delay, it means you can reverse the direction, stop it any time, change the time smoothly or adjust the speed by increasing or decreasing the pitch. To achieve smooth transitions, the plugin can be set to fade up and down automatically in your playing and it can even clear the loop one time after the fade out. The seamless transitions can also be obtained via the inertia free mode that has the role of suppressing the tape-like behavior when you are changing the delay times between the loop lengths. Augustus Loop has also several advanced features such as a reverse reverb section, a parametric EQ section, a stereo reverb section and a spectral analyzer. Moreover, you can adjust the cross-fade at the beginning and the end of the delay, use various modulation sections and even have control of the relative levels of the delay. The plugin is hosted on the Developer's website and you can get it here. There is also a demo available in the same website. The price for this plugin is only USD 5.
